

Top 4 Least Wanted Malware

Remote Access Trojan

A malware program that includes a back door for administrative control over the target computer. RATs are usually downloaded invisibly with a user-requested program - such a game - or sent as an email attachment

Botnet

(Also known as a zombie army) is a number of internet computers that, although their owners are unaware of it, have been set up to forward transmissions (including spam or viruses) to other computers on internet.

Browser-based Malware

(Also known as "Man in the browser") is a security attack where the perpetrator installs a trojan horse on a victim's computer that's capable of modifying that user's web transactions as they occur in real time.

Ransomware

A form of computer malware that restricts access to your computer or its information, while demanding you pay a ransom to get access back
